Steam & electricity production from a boiler station powered by Solid Recovered Fuels

DDMBASLE

The Dombasle Energie project, resulting from the partnership between Solvay and Véolia, aims to design, to build, finance and operate a boiler plant using Solid Recovered Fuels (SRF) to produce steam and electricity for the Dombasle plant operations, in substitution of coal.

| Starting date of the project | 2021 : Pre-project study and facility classified under environmental protection (ICPE) 2022 : Administratives authorisations 2023 - 2024 : Building and industrial commissioning |
|---|--|
| Project Localisation | The project is located on the Dombasle-sur-Meurthe site, in Meurthe-et-Moselle, in the Grand Est Region |
| Places of implementation of the project at this stage and targeted geography if replicable. | (France). |
| Project objectives Type of climate innovation of the project with a description of the problem/issue addressed | Design, build, finance and operate a boiler using Solid Recovered Fuels (SRF) in order to produce steam and electricity for the Solvay Dombasle site for at least 20 years. This boiler substitutes the three coal boilers currently in operation on the site which shall be stopped. |
| Detailed project description | Founded in 1873, Dombasle-sur-Meurthe plant is one of the oldest soda works in the Solvay group and is one of the last two soda plants located in Lorraine. Established on a 50-hectare industrial park the plant houses a production unit as well as a research and development laboratory that works for all the carbonate, bicarbonate and derivatives activities of the Group. |
| | In order to maintain the competitiveness of this site, in the light of its performance and profitability criteria in an increasingly competitive international context, the company Dombasle Énergie was created. It is the result of a partnership between SOLVAY and VEOLIA groups. |
| | Dombasle Energie is carrying out the present project, which consists of designing, building, financing and operating a boiler plant using Solid Recovered Fuels (SRF) to produce steam and electricity for Solvay Dombasle site for at least 20 years. This boiler room will substitute the three coal-fired boilers currently in operation on the site, which will be stopped. |
| | The project allows: To reduce atmospheric emissions by around 50% and CO2 emissions by 240,000 t / year for the Solvay site of Dombasle, or all in all, around 50% of current fossil emissions. The project includes the investment of an efficient treatment of fumes gases and polluting emissions; To eliminate water intake of the coal boilers which today represent 400 to 500 m3 / h To develop matter recovery by structuring the SRF sector and promote circular economy; To secure the thousand direct and indirect jobs at the Solvay's Dombasle site, preserve and create jobs in particular for the preparation of SRF and logistics and to create temporary jobs during the construction of the CSR boiler room. |

| | Scope 1 Direct emissions generated by the company's activity. | Replacement of boilers by two SRF boilers | f three coal | 240 ktCO2/year |
| | Scope 2 Indirect emissions associated with the company's electricity and heat consumption. | | | |
| | Scope 3 Emissions induced (upstream or downstream) by the company's activities, products and/or services in its value chain. | | | |
| | Increase of carbon sinks | | | |
| | Emissions Absorption Carbon sinks creation, | | | |
| | (BECCS, CCU/S,) | oomnony of this | d partico | |
| | Avoided Emissions avoided by the Emissions avoided by the activities, products and/or services in charge of the project, or by the financing of emission reduction projects. | | | |
| | Clarification on the calculation of | or other remarks | s reported in the | ETS audit including |

| | 480 kt omitted by its goal bailers, corresponding to 192 kt of goal consumed, considering an omission factor |
|--|--|
| | of 2.5 tCO2 / tonne of coal. |
| | The SRF emission coefficient, equivalent to that of natural gas, being 2 times lower than that of coal for equivalent energy, the current CO2 emissions emitted by coal boilers will be divided by half. |
| | So, the use of SRF allows a gain of 240 ktCO2 / vear. |
| Modality of verification of the | Calculation standard used (ADEME base, GHG protocol, etc.): Audit ETS |
| quantification. | |
| | Verification of the calculation (internal or external): external verification |
| Other environmental and social benefits of the project | I his project contributes to following SDOs: |
| benefits of the project | SDG 0. Clean water and samation. The project aims to emmate water interes for cooling coal boilers, which today represent 400 to 500 m3 / h, as well as to the zero aqueous discharge |
| | ambition, excluding rainwater and sanitary water (these are always directed to the networks |
| | provided for this purpose). |
| | • SDG 7 : affordable and clean energy : to ensure the sustainability of the site, the facility produces |
| | steam and electricity from the SRF at a competitive price over 20 years |
| | SDG 9 : Industry, innovation and initiastructure : the project promotes the development of a sustainable industry |
| | SDG 12 : responsible consumption and production : the project will contribute to the development |
| | of material recovery, the promotion of the circular economy, as well as the reduction of the |
| | quantities of sorting refusals sent to Storage facilities for non-hazardous wastes. |
| Project maturity lovel | SDG 13 : climate action : the project aims to reduce 240kt CO2 emissions per year. |
| Project maturity level | \square Prototype laboratory lest (TRL 7) \square Real life testing (TRL 7.8) |
| | \Box Pre-commercial prototype (TRL 9) |
| | \Box Small-scale implementation |
| | Medium to large scale implementation |
